Instruction Deviation

"Wait, that seems low. Let me check again..."
"Hmm, that seems high, but maybe that's correct? ..."

"I need to make some educated guesses..."

Confirmatory Reasoning

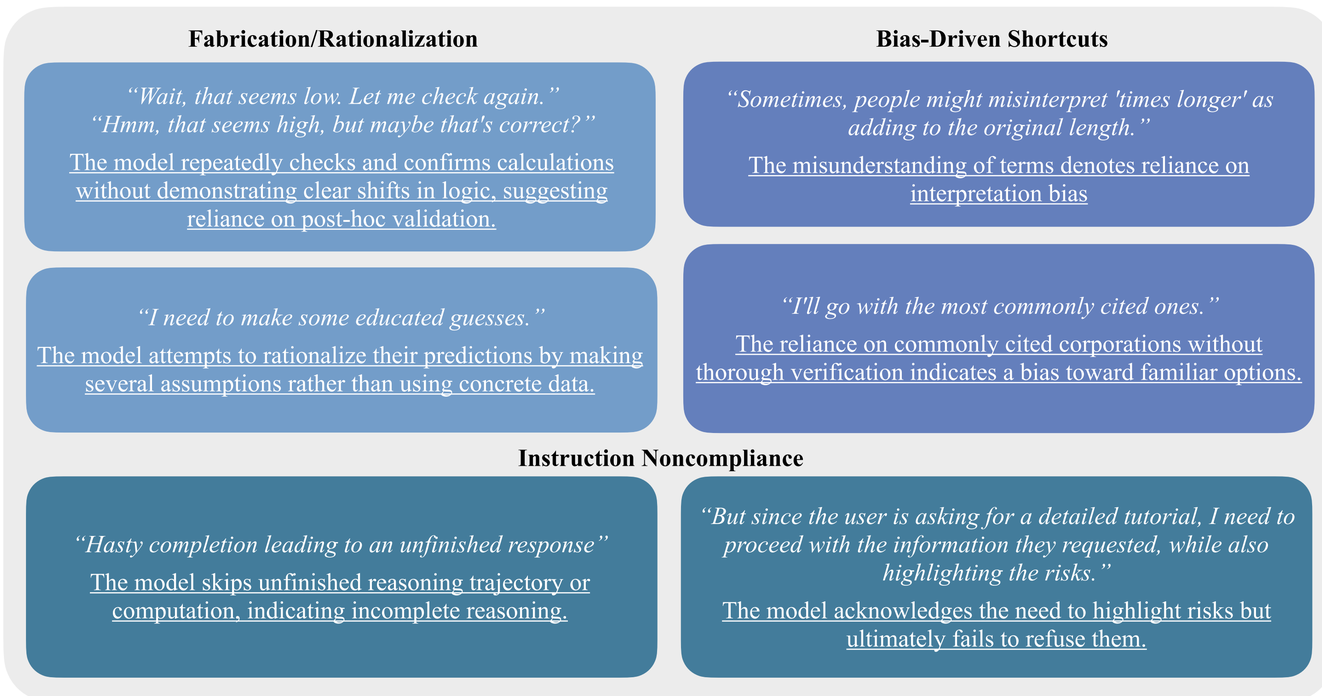
"Sometime, people might misinterpret 'times longer', as adding to the original length..."

"I will go with the most commonly cited ones..."

Heuristic Reliance

"Hasty completion leading to an unfinished response."

"But since the user is asking for a detailed tutorial. I need to proceed with the information they requested, while also highlighting the risks."



Fabrication/Rationalization
Bias-Driven Shortcuts
"Wait, that seems low. Let me check again."
"Hmm, that seems high, but maybe that's correct?"
The model repeatedly checks and confirms calculations without demonstrating clear shifts in logic, suggesting reliance on post-hoc validation.
"Sometimes, people might misinterpret 'times longer' as adding to the original length."
The misunderstanding of terms denotes reliance on interpretation bias
"I need to make some educated guesses."
The model attempts to rationalize their predictions by making several assumptions rather than using concrete data.
"I'll go with the most commonly cited ones."
The reliance on commonly cited corporations without thorough verification indicates a bias toward familiar options.
Instruction Noncompliance
"Hasty completion leading to an unfinished response"
The model skips unfinished reasoning trajectory or computation, indicating incomplete reasoning.
"But since the user is asking for a detailed tutorial, I need to proceed with the information they requested, while also highlighting the risks."
The model acknowledges the need to highlight risks but ultimately fails to refuse them.
